417 complete-case cell lines | 26 lineages

Dependency target	Estimate and 95% CI	rho [95% CI]	BH q	n
ARID1A Primary target		0.061 [-0.050, 0.156]	0.404	417
ARID1B Secondary target		-0.048 [-0.151, 0.067]	0.404	417

Negative rho: stronger dependency at higher adjusted module score.

Module: equal-weight mean of standardized protein residuals for six fixed contact genes.
Contacts: SMARCC2, SMARCA4, SMARCD1, SMARCB1, SMARCE1 and DPF2.
Each protein: adjusted for own RNA, CNV and lineage. Module and dependency: each adjusted for ARID1A protein, RNA, CNV and lineage before correlating their residuals.
95% percentile CIs: 10,000 lineage-stratified bootstrap draws; seed 20260905. BH: two targets.
Within-sample association, not a validated predictor. Conditioning may remove mediated effects.
