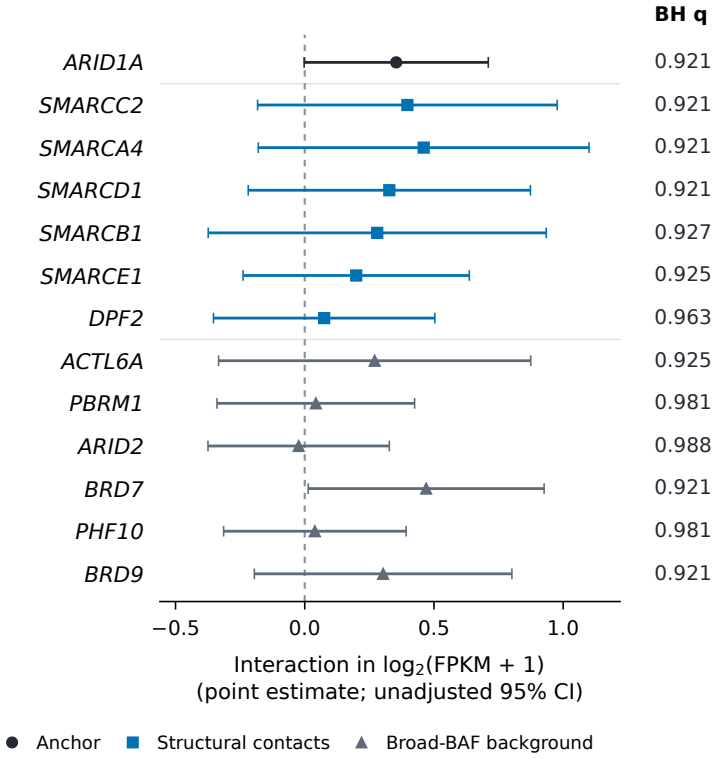
(a) Fixed-panel RNA interaction



(b) MET promoter peak detection

ARID1A	WT	WT	KO	KO
ARID1B	scr	KD	scr	KD
ATAC	2/2	2/2	2/2	2/2
H3K27ac	2/2	2/2	2/2	0/2

Infections with a called promoter peak

TSS −2 kb / +0.5 kb, strand-aware

0 = no called peak, not proven absence. Thresholded calls are not a quantitative differential-accessibility test.

Literature-known MET RNA interaction

Estimate -1.47; genome-wide q = 0.135

Descriptive triangulation; not a new discovery.

```
Interaction = [E(KO,KD) − E(KO,scr)]
            − [E(WT,KD) − E(WT,scr)]
```

Exploratory limma-trend: 0/13,505 genes pass genome-wide BH q < 0.05 for the interaction.

2 independent infections/group; one isogenic ARID1A Q456* line. Expression responses do not establish dependency.
